

Project Goal = **'big picture'**
statement of desired results

**Recovery from the
Impact of Cyclone Evan
and building resilience
for Samoa**
*- our high-level goal for
all recovery programs*

Logic is designed for Results

Project Theory / Logical Framework A

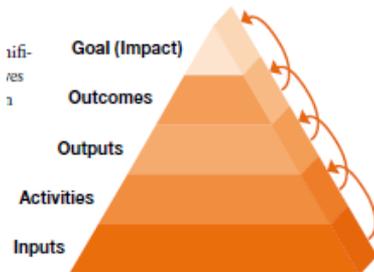

- **impact (broader goal)**
wider & sustainable benefits
- **outcomes (purpose)**
real use of the outputs
- **outputs (results)**
products of the activities
- **activities**
actions taken (and means)
- **inputs**
financial, human, material

If and then Testing – important to test the logic of your programs

Outcomes (often med-term) resulting from the project (+ or - long-term Impacts)

Outputs – deliverables (what we do – products, goods, services)

Indicators

- There are multiple levels – focus on outcome and output level today
- Monitoring indicators enables programs to track progress, demonstrate results and make improvements
- The quality of the indicator will depend on its relevance (to the program), its validity and reliability
- Programs should have a monitoring plan that collects data against indicators (with targets and baselines)

See handouts – SMART list and Indicator traps
Outcome to Output level indicators

Quantitative and qualitative indicators

Quantitative Indicators – numbers – ratios – ranking – percentage – frequency – growth rate

Example: number of bridges on the South Coast that were damaged during TCE repaired and assessed as safe by the commencement of 2014 (Baseline – Target) – questionnaires, surveys, census data, secondary data

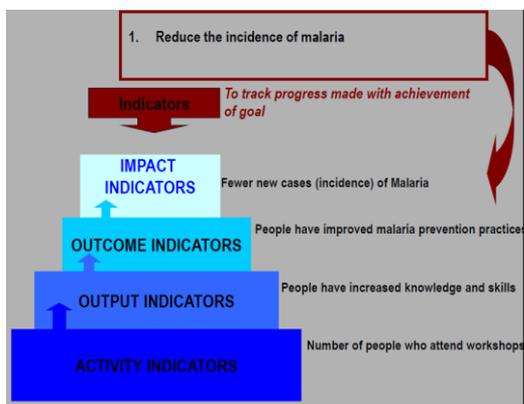

Qualitative Indicators – descriptive (words) – group satisfaction, leadership capacity, attitudinal or behavioural change, practices and behaviours – observed (interviews, focus groups, case studies, observation, secondary data)

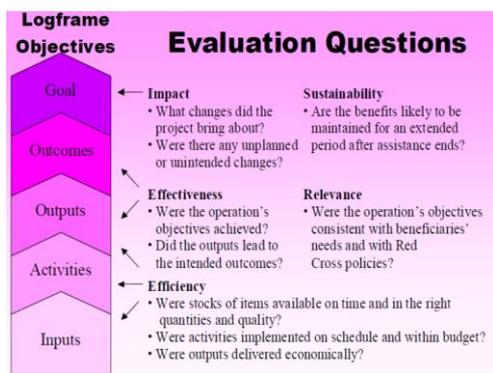

Example: community members' feedback on how they feel about the safety of bridges and their confidence in using them in 2014

Proxy Indicators – when data is not available (eg percent of households with cars (as a proxy for household wealth)

Quantitative or Qualitative

- Indicators can be **quantitative** (eg the % of farmers adopting new technology) or **qualitative** (eg the level of commitment of farmers to using new technology)
- It is best to **use both** (mixed methods)
- It is **usually easier to measure outputs** (because outcomes indicators show changes in behaviour, practices, etc) – but you only need 1-2 indicators at the outcome level.

Baselines

- In order to observe changes, benchmarks against which indicators can be judged – can capture qualitative or quantitative information

See GFDRR handout
Handout on Baselines, Targets, Timelines

Some examples of what data you are collecting – Quantitative - Qualitative

Don't reinvent the wheel...

1. **Are there international standard indicators?** UNAIDS, the UNDP Millennium Development Goals, and the Demographic and Health Surveys have been used and tested extensively.
2. **Are there indicators required by the donor, grant or program?** This can be especially important if the project-level indicator is expected to roll up to a larger accountability framework at the program level.
3. **Are there secondary indicator sources?** It may be cost-effective to adopt indicators for which data have been or will be collected by a government ministry, international agency, and so on.

Data Collection

- Decide how you will collect the data – eg survey, case study, interview, focus group, observation
- Pre-test (especially for surveys, questionnaires, etc)
- Decide how you will code data (quant and/or qual)

Most important things you need:
 Who is going to collect the data?
 Who is going to make sense of it (Data Analysis)?
 Who is going to document the findings?
 Is there money to do this (it is a resource so it should have a budget)

BIAS AND JUMPING TO CONCLUSIONS

Cross Cutting Issues
Disability, Gender, Private Sector and Citizenship
[Click Here](#)

- Programs must take into account cross-cutting issues - **DRR, gender; child protection; disability; environmental protection, and Principles of Recovery**

Your data provides evidence for reports, reviews and evaluations

Lastly

- Keep it simple (**KIS**), focus on what needs to be measured (short + M/Long term) – **use indicators that are easy to monitor**
- Link Results to strategy (eg national plans, sector plans but **keep it specific to the context of CE**)
- **Someone** must be tasked with **collecting data** and **reporting findings**
- Must be resourced – **usually 5%** of program funding
